QUESTION/*VRAAG 3*

3.1 The temperature at which the vapour pressure equals the atmospheric pressure (external pressure). ✓✓ **(2 marks or no marks)**
Die temperatuur waarby die dampdruk gelyk is aan die atmosferiese druk (eksterne druk). ***(2 punte of geen punte nie)*** (2)

3.2

Criteria for conclusion/*Riglyne vir gevolgtrekking*:	
Dependent and independent variables correctly identified. *Afhanklike en onafhanklike veranderlikes korrek geïdentifiseer.*	✓
Relationship between the independent and dependent variables correctly stated./*Verwantskap tussen die afhanklike en onafhanklike veranderlikes korrek genoem.*	✓

Examples/*Voorbeelde*:

- Boiling point increases with increase in number of (C) atoms/chain length/ molecular size/molecular mass.
  Kookpunt neem toe met styging in getal (C)-atome/kettinglengte/ molekulêre grootte/molekulêre massa.
- Boiling point decreases with decrease in number of C atoms/chain length/ molecular size/molecular mass.
  Kookpunt neem af met daling in getal C-atome/kettinglengte/molekulêre grootte/molekulêre massa.
- Boiling point is proportional to number of C atoms/chain length/molecular size/molecular mass.
  Kookpunt is eweredig aan getal C-atome/kettinglengte/molekulêre grootte/ molekulêre massa.

IF/*INDIEN*:
Boiling point is DIRECTLY proportional to number of C atoms/chain length/molecular size/molecular mass: Max. $\frac{1}{2}$
Kookpunt is DIREK eweredig aan getal C-atome/kettinglengte/molekulêre grootte/molekulêre massa: *Maks.* $\frac{1}{2}$ (2)

- Between alkane molecules are London forces/dispersion forces/induced dipole forces.
  Tussen alkaanmolekule is London-kragte/dispersiekragte/geïnduseerde dipoolkragte. ✓
- In addition to London forces and dipole-dipole forces each alcohol molecule has (one site) for hydrogen bonding. ✓
  Behalwe London-kragte en dipool-dipoolkragte het elke alkohol-molekuul een punt vir waterstofbindings.
- In addition to London forces and dipole-dipole forces each carboxylic acid molecule has two sites for hydrogen bonding. ✓ (Accept: more sites/*Aanvaar meer punte*)
  Behalwe London-kragte en dipool-dipoolkragte het elke karboksielsuur-molekuul twee punte vir waterstofbindings.
- Intermolecular forces in carboxylic acids are stronger than intermolecular forces in alkanes and alcohols./Intermolecular forces between alkane and alcohol molecules are weaker than intermolecular forces between carboxylic acid molecules.✓
  Intermolekulêre kragte in karboksielsure is sterker as intermolekulêre kragte in alkane en alkohole./Intermolekulêre kragte tussen alkane en alkohole is swakker as intermolekulêre kragte tussen karboksielsuur-molekule.
- More energy is needed to overcome/break intermolecular forces in carboxylic acids than in the other two compounds. ✓
  Meer energie word benodig om intermolekulêre kragte in karboksielsure as in die ander twee verbindings te oorkom/breek. (5)
